```
private void splitLeafNode(Node correctLeafNode, Node parent) {
/......./获取子节点列表
/......../①更新 distances 数组
childIds.insert(pos,id);//将 id 插入对应位置
/......./初始化新的右侧的叶节点
childIds.removeRange(leftSize, childCount); //③清空分裂出去的
位置
/..../ ④移动 parent 的后续分支的槽位
childrenNodeIds[branchPos + 1] = rightLeaf.getId();
branchDistances[branchPos + 1] =
rightLeaf.distances[rightSize - 1];
branchBounds.insert(branchPos * 2, rightLeaf.distances[0]);
branchBounds.insert(branchPos * 2 + 1,
rightLeaf.distances[rightSize - 1]);
//⑤更新 parent 节点的 branchBounds, branchDistance, childNodes
nodePool.addNode(rightLeaf);
//⑥将 rightLeaf 加入节点池中
```
